2020-03-12

1 Input Dataset

The analysis was conducted on a dataset containing 449 sequences. The average sequence length was 29801.497, with a standard deviation of 315.377. The earliest sample date was 2019-12-01, the median sample date was 2020-02-08, and the most recent sample date was 2020-03-06.

2 Preprocessed Dataset

The input dataset was preprocessed such that sequences were given safe names: non-letters/digits in sequence IDs were converted to underscores. After preprocessing, the dataset contained 449 sequences. The average sequence length was 29801.497, with a standard deviation of 315.377. The earliest sample date was 2019-12-01, the median sample date was 2020-02-08, and the most recent sample date was 2020-03-06.

3 Multiple Sequence Alignment

Multiple sequence alignment was performed using MAFFT (Katoh & Standley, 2013) in automatic mode. There were 30333 positions (10453 invariant) and 397 unique sequences in the multiple sequence alignment. Pairwise distances were computed from the multiple sequence alignment using the tn93 tool of HIV-TRACE (Pond et al., 2018). The average pairwise sequence distance was 0.000269, with a standard deviation of 0.000199.

Figure 2: Distribution of input sample dates

4 Phylogenetic Inference

A maximum-likelihood phylogeny was inferred under the General Time-Reversible (GTR) model (Tavare, 1986) using FastTree 2 (Price et al., 2010) using a Gamma20-based likelihood. The inferred phylogeny was MinVar-rooted using FastRoot (Mai et al., 2017). Pairwise distances were computed from the phylogeny using TreeSwift (Moshiri, 2020). The maximum pairwise phylogenetic distance (i.e., tree diameter) was 0.00416, and the average pairwise phylogenetic distance was 0.000502, with a standard deviation of 0.000357.

5 Phylogenetic Dating

The rooted phylogeny was dated using treedater (Volz & Frost, 2017). The height of the dated tree was 133.463 days, so given that the most recent sample was collected on 2020-03-06, the estimated time of the most recent common ancestor (tMRCA) was 2019-10-24.

6 Ancestral Sequence Reconstruction

Ancestral sequence reconstruction was performed using TreeTime (Sagulenko et al., 2018).

7 Transmission Clustering

Transmission clustering was performed using TreeN93 (Moshiri, 2018) using pairwise phylogenetic distances. The total number of singletons (i.e., non-clustered individuals) was 65, and the total number of clusters (excluding singletons) was 22. The average cluster size (excluding singletons) was 17, with a standard deviation of 50.0491, and the maximum and minimum cluster sizes were 241 and 2, respectively.
